2. Problems

1. Visualizing differences across sites in major taxon abundance

a. Plan your figure

- x-axis: site_full
- y-axis: log_ave_lit
- geometry to represent average abundance/L: geom_jitter()
- geometry to represent medians: stat_summary()

b. Wrangle your data

```
#creating new object frm aq_ins_clean
ostracods <- aq_ins_clean |>
  #filter to only include ostracods
  filter(taxon == "ostracod") |>
  # log + 1 transform mean abundance per liter
  mutate(log_ave_lit = log(ave_lit + 1))

#display 10 random observations
ostracods |>
  slice_sample(n = 10)
```

A tibble: 10 x 24

theme_bw()

ostracods_plot

```

d. Create a multi panel figure

```
#using patchwork to create multipanel figure
# *used chatgpt for help*
salinity /
  (copepods | ostracods_plot)
```

e. Interpret your figure

Differences in copepod and ostracod abundance vary across sites, with South of Venoco Bridge having the highest average copepod abundance with Devereux Creek following. This contrasts average ostracod abundance as South of Venoco Bridge has a very low average ostracod abundance, Devereux Creek has a similar amount of ostracods, and overall South of Phelps Bridge has the highest average ostracod abundance.

Ostracod abundance seems to not follow site differences in salinity / it appears to be influenced by other factors. For example, South of Phelps Bridge and Devereux Creek has the highest ostracod abundance, and also has low salinity (ppt), however so does Phelps Road and North of Phelps Bridge however they have low ostracod abundances.

2. Visualizing total abundance as a function of salinity

a. Plan your figure

- x-axis: med_sal
- y-axis: log_ave_lit
- color: taxon
- geometry: geom_point()
- facets: facet_wrap(~ taxon, scales = "free")

b. Wrangle your data

```
#creating new object from aq_ins_clean
aq_ins_new <- aq_ins_clean |>
  # create log transformed abundance column
  mutate(log_ave_lit = log(ave_lit + 1),
         #asked chat gpt for help to replace dashes with spaces in taxon names
         taxon = str_replace_all(taxon, "_", " "),
         taxon = str_to_title(taxon)) |>
  select(site_full,
         taxon,
         med_sal,
         ave_lit,
         log_ave_lit) |>
  #asked chat gpt for help reordering
  mutate(taxon = fct_reorder(taxon, ave_lit, .fun = max, .desc = TRUE, .na_rm = TRUE))

aq_ins_new |>
  slice_sample(n = 10)
```

A tibble: 10 x 5

site_full	taxon	med_sal	ave_lit	log_ave_lit
<fct>	<fct>	<dbl>	<dbl>	<dbl>
1 South of Venoco Bridge	Annelida Polychaete	NA	0	0
2 Devereux Creek	Diptera Chironomid	NA	0	0

3	Devereux Creek	Cladocera	NA	0	0
4	Main Channel	Annelida Polychaete	NA	0	0
5	South of Venoco Bridge	Ostracod	NA	0.267	0.236
6	South of Venoco Bridge	Nematode	7.01	0	0
7	North of Venoco Bridge	Diptera Ceratopogonidae	NA	0.533	0.427
8	South of Venoco Bridge	Copepod	NA	34	3.56
9	North of Venoco Bridge	Diptera Chironomid	45.2	0	0
10	North of Phelps Bridge	Diptera Ceratopogonidae	NA	0	0

c. Code your figure

```
ggplot(data = aq_ins_new,
       mapping = aes(x = med_sal,
                     y = log_ave_lit,
                     color = taxon)) +
  geom_point() +
  facet_wrap(~taxon, scales = "free") +
  scale_color_viridis_d(option = "H") +
  theme_bw() +
  theme(legend.position = "none") +
  labs(x = "Median Salinity (ppt)",
       y = "log + 1 transformed average abundance/L",
       title = "Aquatic Invertebrate Abundance Across Salinity")
```

d. Interpret your figure

Relationships between salinity and abundance varied across taxa. Ostracods, Copepods, Diptera Chironomids, and Cladoceras seemed to have relatively high abundances at low salinity, showing a possible negative relationship between salinity and abundance among these taxa. Several taxa such as Nematodes, Diptera Ceratopogonidae, Annelida Oligochaete, Annelida Polychaete, and Hemiptera Corixidae Boatmas didn't reveal a relationship as taxon abundance was low across salinity or points seemed sporadic compared to salinity.
